

Hiera Data to configure nginx

You had previously created a parameterized class for nginx to accept configuration parameters. You are now tasked with providing the same parameters using hiera.

- Create a new hierarchy in hiera.yaml using fact “osfamily”. This should take precedence over clientcert
- Add hieradata yaml configuration for RedHat osfamily. Provide the following configuration parameters (same as configured while parameterizing nginx class)
 - user
 - worker_processes
 - error_log
 - pid
 - worker_connections
 - sendfile
 - keepalive_timeout
- Apply changes to the node

Validation

- Once applied, /etc/nginx/nginx.conf should now take parameters provided by hiera.
