

## Defined type to manage Users and ~/.bashrc

You are tasked with creating a defined type for users, which will not only create the users, but also manage their .bashrc file

- Create a new module called human
- Create a new manifest modules/human/manifests/user.pp to hold this defined type
- Create a defined type human::user
- Add a resource to create the user
- While creating user resource, find out the attribute which lets puppet manage home directories. Unless this attribute is set, home directory of a user will not be created. Set this attribute to true.
- Add a template for bashrc.erb. Refer to your system to create this template.
- Add another resource which will create/manage .bashrc file for that user. Location of bashrc file is /home/\$username/.bashrc

### Validation

- Call the defined type and validate if the user is being created with bashrc template that you provided.
